## STRONG EXPLORATION RESULTS CONTINUE AT BOTH KARLAWINDA AND MT GIBSON

## Highlights

## Karlawinda Gold Project (KGP)

- RC drilling at the newly identified Berwick prospect, located 2 kilometres east of the Bibra open pit, has detected near surface gold mineralisation over a 500 metre strike length.
- A 73 hole ( 10,983 metres) first pass RC drill programme was completed at the Berwick prospect with strong results received including:
- 8 metres @ $14.9 \mathrm{~g} / \mathrm{t}$ from 74 metres • 5 metres @ $9.37 \mathrm{~g} / \mathrm{t}$ from 99 metres
- 4 metres @ $11.25 \mathrm{~g} / \mathrm{t}$ from 45 metres • 6 metres @ $4.11 \mathrm{~g} / \mathrm{t}$ from 47 metres
- 12 metres @ $2.74 \mathrm{~g} / \mathrm{t}$ from 75 metres • 2 metres @ $9.36 \mathrm{~g} / \mathrm{t}$ from 78 metres
- A 5,000 metre infill and extensional RC drilling programme has commenced to follow-up these exciting results.
- A total of 10 RC holes for 1,926 metres of infill drilling was completed at the Vedas prospect located 5 kilometres east of the Bibra open pit with encouraging results received including:
- 8 metres @ $4.36 \mathrm{~g} / \mathrm{t}$ from 84 metres • 10 metres @ $1.51 \mathrm{~g} / \mathrm{t}$ from 145 metres
- 8 metres @ $2.24 \mathrm{~g} / \mathrm{t}$ from 112 metres • 4 metres @ $1.64 \mathrm{~g} / \mathrm{t}$ from 104 metres
- A follow-up extensional and infill RC drill programme is planned for the June 2023 quarter.
- Field composite assays received from drilling completed in the December 2022 quarter at the Carnoustie prospect returned encouraging 1 m split results which included:
- 5 metres @ 4.09g/t from 149 metres
- 5 metres @ $1.21 \mathrm{~g} / \mathrm{t}$ from 158 metres
- A 15,000 metre regional AC drilling programme is scheduled to commence in the June 2023 quarter across the broader KGP tenement package including the Jamie Well East, Donomore and Carrot Hill prospects.

## Mt Gibson Gold Project (MGGP)

- A further 15,468 metres of RC resource definition and extensional drilling was completed to the end of March 2023 at the MGGP.
- Assays received from 14 resource definition holes since the last update in January 2023 continue to return exceptional results within and extensional to the resource including:

## Outside current resource

- 15 metres @ $7.11 \mathrm{~g} / \mathrm{t}$ from 165 to 180 m • 5 metres @ 16.28g/t from 163 to 168m
- 27 metres @ 1.76g/t from 183 to 210 m • 5 metres @ 8.36g/t from 12 to 17 m
- 4 metres @ 10.04g/t from 204 to 208m • 1 metres @ 33.70g/t from 109 to 110m

## Within current resource

- 5 metres @ 11.99g/t from 85 to 90 m
- 8 metres @ 4.95g/t from 43 to 51 m
- 6 metres @ $5.05 \mathrm{~g} / \mathrm{t}$ from 126 to 132 m
- 11 metres @ $5.29 \mathrm{~g} / \mathrm{t}$ from 39 to 50 m
- 9 metres @ $3.37 \mathrm{~g} / \mathrm{t}$ from 30 to 39 m
- 8 metres @ $3.77 \mathrm{~g} / \mathrm{t}$ from 74 to 82 m
- Drilling on the unmined S2, Lexington Waste Dump and Orion North trends (east of the main Gibson trend) continue to define zones of high-grade within and outside the updated 2022 resource shell.
- Regional AC drilling programme at the Outlaw prospect within the Highway/McDonalds area commenced during the reporting period, with 486 holes for 12,838 metres completed.
- Confirmatory AC drilling programme consisting of 329 Aircore holes for 10,867 metres were drilled over existing historic mineralised heap leach dump within the MGGP mine centre.

Mt Gibson Gold Project

## Karlawinda Gold Project

## Near Mine Exploration

Exploration activities since the last update have focussed on drilling current and newly identified near mine targets at the KGP. A total of 83 RC holes for 12,909 metres were completed across the Vedas prospect and the newly identified Berwick prospect with encouraging results including:

| Hole ID | Easting | Northing | From (m) | Depth $(\mathbf{m})$ | Width | Grade (g/t Au) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| KBRC1943 | 206914 | 7367355 | 97 | 106 | 9 | 1.18 |
| KBRC1946 | 206812 | 7367295 | 74 | 82 | 8 | 14.9 |
| KBRC1949 | 203881 | 7368638 | 15 | 27 | 12 | 1.28 |
| KBRC1950 | 204154 | 7368797 | 20 | 30 | 10 | 2.03 |
| KBRC1950 | 204154 | 7368797 | 38 | 54 | 16 | 1.23 |
| KBRC1951 | 203721 | 7369095 | 43 | 67 | 24 | 0.64 |
| KBRC1951 | 203721 | 7369095 | 80 | 82 | 2 | 14.92 |
| KBRC1952 | 203792 | 7368765 | 69 | 93 | 24 | 0.71 |
| KBRC1967 | 209124 | 7367086 | 84 | 92 | 8 | 4.36 |
| KBRC1969 | 209472 | 7366874 | 112 | 120 | 8 | 2.24 |
| KBRC1974 | 206863 | 7367690 | 126 | 130 | 4 | 3.4 |
| KBRC1976 | 206876 | 7367337 | 60 | 64 | 4 | 2.81 |
| KBRC1980 | 209493 | 7366931 | 145 | 155 | 10 | 1.51 |
| KBRC1985 | 206958 | 7367283 | 48 | 52 | 4 | 2.73 |
| KBRC1987 | 206819 | 7367203 | 242 | 248 | 6 | 6.54 |
| KBRC1987 | 206819 | 7367203 | 71 | 75 | 4 | 11.25 |
| KBRC1990 | 206791 | 7367094 | 263 | 264 | 1 | 17.28 |
| KBRC1995 | 206827 | 7367210 | 99 | 104 | 5 | 9.37 |
| KBRC1997 | 206864 | 7367286 | 86 | 95 | 9 | 1.33 |
| KBRC1998 | 206819 | 7367266 | 75 | 87 | 12 | 2.74 |
| KBRC1999 | 206819 | 7367266 | 80 | 83 | 3 | 4.02 |
| KBRC2001 | 207035 | 7367391 | 37 | 41 | 4 | 2.86 |
| KBRC2004 | 206880 | 7367359 | 64 | 66 | 2 | 5.06 |

A comprehensive table of significant results is included in Appendix 1.

Figure 1. Karlawinda current near mine exploration targets
The early success of this programme highlights the potential of the project to host multiple satellite deposits in proximity to existing operations and infrastructure.

## Berwick Prospect

During the March 2023 quarter 73 RC holes for 10,983 metres were completed at the newly identified Berwick prospect situated approximately 2 kilometres east of the Bibra open pit (refer to Figure 1). Drilling has identified near surface gold mineralisation over a 500 metre strike. Mineralisation is hosted by silicified bands within migmatite (composite rock found in medium and high-grade metamorphic environments) which appears to be controlled by folding and remains open down dip and along strike.
Several promising results were returned from this first pass drilling programme including:

- 8 metres @ $14.9 \mathrm{~g} / \mathrm{t}$ from 74 metres
- 5 metres @ $9.37 \mathrm{~g} / \mathrm{t}$ from 99 metres
- 4 metres @ $11.25 \mathrm{~g} / \mathrm{t}$ from 45 metres
- 6 metres @ $4.11 \mathrm{~g} / \mathrm{t}$ from 47 metres
- 12 metres @ 2.74 g/t from 75 metres
- 2 metres @ $9.36 \mathrm{~g} / \mathrm{t}$ from 78 metres

A follow up infill and extensional 5,000 metre RC drilling programme has commenced to allow the estimation of a mineral resource in the June 2023 quarter.

Figure 2. Drilling completed at the Berwick prospect with current significant intercept locations

Figure 3: Berwick section with broad and high-grade mineralisation intersected throughout the project area.

## Vedas

The Vedas prospect is located 5 kilometres east of the Bibra open pit (refer to Figure 1). During the March 2023 quarter 10 RC holes for 1,926 metres were completed infilling previously reported drill intercepts. Current results confirm a 400 metre strike length which remains open down dip and along strike. Mineralisation at Vedas is analogous with the Bibra deposit, with gold hosted in moderately north dipping zones of intense silica+sericite+biotite+pyirite+asrenopyite alteration bound by magnetite. A 5,000 metre extensional and infill RC drilling programme is planned to commence following the drill out of the Berwick prospect with results used to complete a mineral resource estimate in due course.

Figure 4. Drilling completed at the Muirfield-Vedas trend.

Figure 5. Vedas cross-section with broad mineralisation.

## Carnoustie

The Carnoustie prospect is located 5 kilometres northwest of Bibra along the Karlawinda Thrust (refer to Figure 1). A total of 10 RC Holes ( 2,148 metres) and 31 Aircore holes ( 2,072 metres) of a near mine drilling programme were completed in the December 2022 quarter targeting a steeply dipping north-south striking structure that had been intersected in previous drilling. Assays received since the last update have identified that mineralisation increases in grade around the fresh rock boundary and remains open down dip and along strike to the north. Follow up drilling is planned in the June 2023 quarter. Significant 1m split results from recent drilling include:

- 5 metres @ $4.09 \mathrm{~g} / \mathrm{t}$ from 149 metres
- 5 metres @ $1.21 \mathrm{~g} / \mathrm{t}$ from 158 metres

Figure 6. Drilling completed at the Carnoustie project with significant intercepts location showing mineralisation intersected along a north south striking corridor.

## Regional Exploration

## AC Drilling

A 15,000 metre first pass regional AC drilling programme is set to commence across the broader KGP tenement package with drilling planned at the newly defined Carrot Hill, Donomore and Jamie Well East Prospects (refer figure 7). Infill drilling will also be completed at Jamie Well and Forfar to follow up on anomalous Au and pathfinder results from 2022 drilling. The project areas are situated proximal to either the Nanjilgardy Fault or the Sylvania Inlier and Pilbara Craton margin.
The Nanjilgardy Fault is a regional scale structure that is known to have controls on gold mineralisation in the Pilbara craton, including the Paulsens (ASX: BC8) and Ashburton (ASX: KZR) gold projects. Situated on the southern extents of CMM tenure, the Sylvania Inlier and Pilbara Craton margin is considered a high strain zone with high prospectivity for mineralising fluids with origins from igneous intrusions formed from partial melting of a mantle wedge or enriched fluid
remobilisation through regional metamorphism. This Craton boundary is interpreted to play a significant role in the placement of ore forming fluids at the +2 Moz Bibra gold deposit.

Figure 7. Karlawinda regional and near mine exploration targets
Carrot Hill is located 7 kilometres NW of Bibra along the Karlawinda Thrust zone. Drilling will cover 700 hectares testing coinciding gravity and magnetic highs, and anomalous soil high temperature path finders known to be associated with intrusion related gold systems (Au, As, Cu, Mo, Pb, W).
The Donomore prospect is located along the Sylvania Inlier and Pilbara Craton margin. The prospect sits entirely undercover and consists of 5 kilometres of northwest trending magnetic high anomalies that are crosscut by the regional scale Fortescue Fault and is along strike from the historic Deadmans Flat mine.
In 2022 regional first pass AC was completed at Jaime Well, 50 kilometres northeast of Bibra. Infill drilling will be completed next quarter following up on anomalous $\mathrm{Au}(4 \mathrm{~m} @ 0.5 \mathrm{~g} / \mathrm{t}$ from 16 m in KBAC2617) and pathfinders intersected along shear zones. The area consists of basalt, dolerite, sediments, and chlorite schist/ultramafic rocks.
Ethnographic clearance surveys have been completed on the Mumbakine Well tenement acquired in 2022. The tenement is contiguous to Capricorn's KGP tenure and is less than 10 kilometres from the processing facility and Bibra open pit. A 1,000 sample soil program is set to commence in the June 2023 quarter.

## Mt Gibson Gold Project

## Near mine RC Drilling

Exploration activities at the MGGP during the March 2023 quarter focussed on progressing the extensional and infill resource drilling that commenced in January 2022. One RC rig continued during the March 2023 quarter completing 9,785 metres of drilling taking the total RC drilling to date to 130,607 metres ( 784 holes).

Figure 8. Completed drilling over the MGGP 8km long mine trend along with remaining current resource drillng, first pass western exploration holes and sterilisation drilling.

Assays have now been received from the first 672 holes from the projects resource definition drilling. A total of 1,853 holes for 174,465 metres of resource, regional exploration and mine development drilling has been completed at the MGGP since January 2022. Assays received since the last update continue to return very encouraging results, including:

| Hole ID | Easting | Northing | From (m) | Depth (m) | Width | Grade (g/t Au) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

[^0]A comprehensive table of significant results is included in Appendix 1.
Results of this additional drilling will form the basis to update the 2.755 million ounce MRE targeted for completion in the June 2023 quarter.
Current and previously reported drilling at the depth extremities of the resource optimisation shells (where historic drill density is broader spaced) and below them has returned results consistent with Capricorn's geological interpretations of mineralisation location, widths and grade tenor. Drilling across the project to date indicates that mineralisation remains open down dip and along strike to the north and south with multiple stacked lodes intersected.

## S2, Lexington Waste Dump and Orion North trend

Drilling on the unmined S2, Lexington Waste Dump and Orion North trends (east of the main Gibson trend) continues to define zones of high-grade within and outside the updated 2022 resource shell (refer Figure's 9-11).

## Cross Sections

The plan in Figure 8 above shows the drilling activity from the infill and extensional RC programme and the location of the following long and cross sections.

Figure 9. Lexington Pit and Waste Dump Section with significant broad high-grade mineralisation intersected outside of the current A\$1,900/oz Reserve Outline

Figure 10. Lexington Waste Dump Section with significant broad high-grade mineralisation intersected outside of the current A\$1,900/oz Reserve Outline

Figure 11. S2 Section with significant broad mineralisation intersected outside of the current A\$2,2000/oz Resource Outline

## Regional Exploration

First pass Aircore drilling at The Outlaw prospect within the Highway/McDonalds area commenced during the March 2023 quarter with 486 holes for 12,838 metres completed. The Highway/McDonalds area is located 5 kilometres north of the current resources and has been identified as a significant exploration target. The area has a prospective geological and structural setting with much of the area covered by up to 20 metres of transported cover.

Approximately half of the results have been returned to date. Encouraging zones of anomalous Au and pathfinders including $\mathrm{Ag}, \mathrm{Cu}$, and As associated with north east striking shear zones within amphibolite rocks have been identified. 50 metre spaced infill drilling has been completed around areas of interest with results due in the June 2023 quarter. Encouraging first pass 4 metre composite Au results include:

- 4 metres @ 0.55g/t From 8 to $12 m$
- 4 metres @ 0.94g/t From 16 to 20m
- 4 metres @ 0.65g/t from 44 to $38 m$
- 4 metres @ 0.60 g/t From 4 to 8m

The area represents a unique opportunity to discover economic deposits close to surface on underexplored ground with significant historical workings located across Capricorn tenure. Drilling has confirmed the mineralisation is within amphibolite hosted shear zones in a similar orientation and geological setting to the nearby Mt Gibson Mine Trend.

Figure 12. Completed AC drilling at the Outlaw prospect with known historic gold occurrences and current Capricorn significant gold intercepts

## Heap Leach Dump Drilling

329 Aircore holes for 10,867 metres were drilled during the March 2023 quarter over an existing historic heap leach dump within the MGGP mine centre. In 2002 the 4 mt dump leach was drilled by Oriole Resources Ltd to evaluate residual grades. WAMEX reporting outlines that a total of 141 holes of Aircore were drilled for 2,581 metres ${ }^{1}$.

The drilling was designed to increase confidence in gold distribution and to aid in any future maiden JORC compliant resource estimations. Approximately $70 \%$ of assays have been received with final results expected to be returned in the June 2023 quarter. Significant results include:

- 5 metres @ 8.36g/t From 12 to $17 m$
- 14 metres@1.1g/t From 10 to 24m
- 19 metres @ 0.85g/t From 2 to $21 m$
- 15 metres @ 0.84 g/t From 1 to $16 m$

Completed resource drilling at the Orion pit looking northwest towards the current heap leach dump.
${ }^{1}$ WAMEX report A53618, Mt. Gibson Project M59/11, 13-17, 166, 217, 304, 305, 308, 309, 328, 402-404 Combined Interim Report for Period 31/1/2001-30/1/2002 South Murchison Mineral Field GSWA Ref C246/1993.

## Forward Looking Statements

This announcement may contain certain "forward-looking statements" which may not have been based solely on historical facts, but rather may be based on the Company's current expectations about future events and results. Where the Company expresses or implies an expectation of belief as to future events or results, such expectation or belief is expressed in good faith and believed to have a reasonable basis. The detailed reasons for that conclusion are outlined throughout this announcement and all material assumptions are disclosed.
However, forward looking statements are subject to risks, uncertainties, assumptions and other factors, which could cause actual results to differ materially from future results expressed, projected or implied by such forward-looking statements.

Such risks include, but are not limited to resource risk, metals price volatility, currency fluctuations, increased production costs and variances in ore grade or recovery rates from those assumed in mining plans, as well as governmental regulation and judicial outcomes.
For a more detailed discussion of such risks and other factors, see the Company's Annual Reports, as well as the Company's other filings. Readers should not place undue reliance on forward looking information. The Company does not undertake any obligation to release publicly any revisions to any "forward looking statement" to reflect events or circumstances after the date of this announcement, or to reflect the occurrence of unanticipated events, except as may be required under applicable securities laws.

## Competent Persons Statement

The information in this report that relates to Exploration Results is based on information compiled or reviewed by Mr. William Higgins who is a full-time employee of the Company. Mr. Higgins is a current Member of the Australian Institute of Geoscientists and has sufficient experience, which is relevant to the style of mineralisation and types of deposit under consideration and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code of Reporting of Exploration Results, Mineral Resources and Ore Reserves". Mr. Higgins consents to the inclusion in the report of the matters based on the information in the form and context in which it appears.
The detailed information relating to the Ore Reserves and Mineral Resources reported in this announcement were announced in the Company's ASX announcements dated 27 October 2022, 7 November 2022 and 19 April 2023. The Company confirms that it is not aware of any new information or data that materially affects the information included in the ASX announcements dated 27 October 2022, 7 November 2022 and 19 April 2023 and all material assumptions and technical parameters underpinning the estimates in the relevant market announcements continue to apply and have not materially changed. The Company confirms that the form and context in which the Competent Persons' findings are presented have not materially changed from previous market announcements. The reports are available to view on the ASX website and on the Company's website at www.capmetals.com.au .

The Competent Person's consents remain in place for subsequent releases by the Company of the same information in the same form and context, until the consent is withdrawn or replaced by subsequent report and accompanying consent

## Appendix 2

JORC Code, 2012 Edition - Table 1

## Section 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria JORC Code explanation

## Sampling technique techniques

- Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.
- Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.
- Aspects of the determination of mineralisation that are Material to the Public Report.
- In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.

## Commentary

RC drilling at KGP and MGGP completed by Topdrill with the same techniques and process at both. For Reverse Circulation (RC) drilling 2 kg - 3 kg samples are split from dry 1 m bulk samples. The sample was collected through a cyclone and cone splitter. Once drilling reached fresh rock a fine spray of water was used to suppress dust and limit the loss of fines thorough the cyclone chimney
For regional first pass RC drilling 1m sample was collected in a bucket and then tipped in neat lines on the ground. The piles were then sampled by using a spear to collect a field composite ( $4 \mathrm{~m} R \mathrm{RC}$ ) 2.0 kg to 3.0 kg sample which was then placed in a calico bag. Field duplicates were not collected for the regional RC drilling. CRM were inserted at a ratio of 1:30 composites for regional RC. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges. $+100-$ 200ppb will then have their corresponding 1 m rig split samples sent for fire assay with the below 1 m QAQC applied appropriate for use in JORC resource reporting

1 m RC Field duplicates were collected at a ratio of 1:40 and collected at the same time as the original sample through the B chute of the cone splitter. Matrix matched CRMS and OREAS certified reference material (CRM) were inserted at a ratio of 1:40. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges.
Samples were sent to the laboratory where they were pulverised to produce a 50 g charge for fire assay.
For regional aircore exploration ( AC ) drilling a primary sample was collected from the drill rig. The sample was collected in a bucket and then tipped in neat lines on the ground. The piles were then sampled by using a spear to collect a field composite $(4 \mathrm{~m} \mathrm{AC}) 2.0 \mathrm{~kg}$ to 3.0 kg sample which was then placed in a calico bag. The last 1 m interval for each regional AC hole $(\mathrm{EOH})$ was sampled separately for multi element analysis.
Field duplicates were not collected for the regional AC drilling. CRM were inserted at a ratio of 1:30 composites for regional AC. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges.
Regional AC samples were sent to ALS laboratory where they were pulverised to produce a 25 g charge for aqua regia 51 elements including Au and element multielement analysis for the field charge for aqua
composites using ALS code AuME-TL43analysis.

Heap Leach AC was collected in 1m calicos using regional AC drilling techniques with a splitter off the cyclone, with drilling producing $2 \mathrm{~kg}-3 \mathrm{~kg}$ samples which are split from dry 1 m bulk samples. Field

## Criteria JORC Code explanation

|  |  |
| :---: | :---: |
| Drilling techniques | - Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). |
| Drill sample recovery | - Method of recording and assessing core and chip sample recoveries and results assessed. <br> - Measures taken to maximise sample recovery and ensure representative nature of the samples. <br> - Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. |
| Logging | - Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. <br> - Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. <br> - The total length and percentage of the relevant intersections logged. |
| Sub-samplingtechniques <br> sample <br> sreparationand | - If core, whether cut or sawn and whether quarter, half or all core taken. <br> - If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. <br> - For all sample types, the nature, quality and appropriateness of the sample preparation technique. <br> - Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. <br> - Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling. <br> - Whether sample sizes are appropriate to the grain size of the material being sampled. |

## Commentary

duplicates were collected at a ratio of 1:40 and collected at the same time as the original sample through the B chute of the cone splitter. Matrix matched CRMS and OREAS certified reference material (CRM) were inserted at a ratio of 1:40. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges. Samples were sent to the laboratory where they were pulverised to produce a 50 g charge for fire assay
RC: Topdrill Drilling drill rig was used to drill the RC drill holes: Hole diameter was 140 mm .
AC : Prospect Drilling was used for AC drilling using an 89 mm blade bit.
RC : Once drilling reached fresh rock a fine spray of water was used to suppress dust and limit the loss of fines thorough the cyclone chimney.

At the end of each metre the bit was lifted off the bottom to separate each metre drilled.
The majority of samples were of good quality with ground water having minimal effect on sample quality or recovery. There is no obvious relationship between sample recovery and grade.
AC: Visual recovery information was collected at the time of the AC drilling.
Reverse circulation chips were washed and stored in chip trays in 1 m intervals for the entire length of each hole. Chip trays were stored on site in a sealed container. Chips were visually inspected and logged by an on-site geologist to record lithology (including rock type, oxidation state, weathering, grain size, colour, mineralogy, and texture), alteration, mineralisation, veining, structure, sample quality (dry/wet, contamination) and approximate water flow down hole. Mineralisation, veining and water flow were quantitative or semi-quantitative in nature; the remainder of logging was qualitative

Logging is both qualitative and quantitative or semi-quantitative in nature
AC : AC chips were washed and stored in chip trays in 1 m intervals for the entire length of each hole. Holes of interest are retained, all others are disposed of. Chip trays of all EOH intervals are retained Chip trays were stored on site in a sealed container. Chips were visually inspected and logged by an on-site geologist to record lithology (including rock type, oxidation state, weathering, grain size, colour, mineralogy, and texture), alteration, mineralisation, veining, structure, sample quality dry/wet, contamination) and approximate water flow down hole. Mineralisation, veining and wate flow were quantitative or semi-quantitative in nature; the remainder of logging was qualitative

RC holes samples were split from dry, 1m bulk samples via a cone splitter directly from the cyclone.
RC Field duplicates were collected at a ratio of 1:40 and collected at the same time as the original sample through the B chute of the cone splitter. Matrix matched CRMS and OREAS certified reference material (CRM) were inserted at a ratio of 1:40. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges.

The duplicates and CRM's were submitted to the lab using unique sample ID's.
$2 \mathrm{~kg}-3 \mathrm{~kg} \mathrm{RC}$ samples are submitted to the laboratory.

## Criteria

## JORC Code explanation

|  |  |
| :---: | :---: |
| Quality of assay data and laboratory tests | - The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. <br> - For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. <br> - Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established. |
| Verification  <br> of <br> sampling <br> assaying and | - The verification of significant intersections by either independent or alternative company personnel. <br> - The use of twinned holes. <br> - Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. |

## Commentary

Samples are oven dried at $105^{\circ} \mathrm{C}$ then jaw crushed to -10 mm followed by a Boyd crush to a nominal -2 mm . Samples were rotary split to 2.5 kg . Samples were then pulverised in LM5 mills to $85 \%$ passing $75 \mu \mathrm{~m}$ under sample preparation code SP3000 which consists of a 5 -minute extended preparation for $\mathrm{RC} / \mathrm{Soil} / \mathrm{RAB}$. The extended time for the pulverisation is to improve the pulverisation of samples due to the presence of garnets in the samples.
All the samples were analysed for Au using the FA50AAS technique which is a 50 g lead collection fire assay.

This sample preparation technique is appropriate for the MGGP and KGP; and is standard industry practice for a gold deposit.

Samples greater than 3 kg are split prior to pulverizing and the remainder discarded.
Regional AC samples were collected as 4 m field composites using a spear from the individual 1 m sample piles on the ground. Field duplicates were not collected for the regional AC drilling. CRM were inserted at a ratio of 1:30 composites for AC. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges. The CRM's were submitted to the lab using unique sample ID's. $2 \mathrm{~kg}-3 \mathrm{~kg}$ AC samples are submitted to the laboratory. Samples are oven dried at $105^{\circ} \mathrm{C}$ then crushed and pulverised

Heap Leach AC was collected in 1 m calicos using regional AC drilling Techniques with a splitter off the cyclone, with drilling producing $2 \mathrm{~kg}-3 \mathrm{~kg}$ samples which are split from dry 1 m bulk samples. Field duplicates were collected at a ratio of 1:40 and collected at the same time as the original sample through the B chute of the cone splitter. Matrix matched CRMS and OREAS certified reference material (CRM) were inserted at a ratio of 1:40. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges. Samples were sent to the laboratory where they were pulverised to produce a 50 g charge for fire assay.

RC: Drilling samples were submitted to Jinnings and ALS in Perth. 1m RC samples were assayed by a 50 gm fire assay which is a total assay.

RC Field duplicates were collected at a ratio of 1:40 and collected at the same time as the original sample through the B chute of the cone splitter. Matrix matched CRMS and OREAS certified reference material (CRM) were inserted at a ratio of 1:40. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges.

Regional AC drilling samples were submitted to ALS laboratory in Perth. No field duplicates were collected for the AC drilling. CRM were inserted at a ratio of $1: 30$ composites for the AC. The grade ranges of the CRM's were selected based on grade populations and economic grade ranges.

Logging and sampling were recorded directly into a Micromine Geobank template, which utilises lookup tables and in file validation on a Toughbook by the geologist on the rig. Validated data was sent to the database administrator in Perth who then carried out independent verifications using Maxwell's Datashed.

## Criteria

## JORC Code explanation

- Discuss any adjustment to assay data.

|  | - Discuss any adjustment to assay data. |
| :---: | :---: |
| Location of data points | - Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. <br> - Specification of the grid system used. <br> - Quality and adequacy of topographic control. |

## Commentary

Assay results when received were plotted on section and were verified against neighbouring holes.
QAQC reports were generated on a hole-by-hole basis by the database administrator as results were received.

Capricorn Metals sampling, data collection in field is captured in an electronic logging system for geological, regolith, sample id, assay and surveying information.

All Drillhole collar positions were surveyed using hand held GPS. Drillhole location data was initially captured in the MGA94 grid system. Before further resource evaluation work the drillhole locations will be picked up with DGPS by qualified surveyors.

Down hole surveys were undertaken on 30 m increments from end of hole, using a Reflex down hole gyroscopic tool.

The natural surface topography was modelled using a DTM generated from airborne survey, this includes waste dumps and some in-pit waste dumping. Also available are pit surveys of the mining voids at the end of historical mining to enable depletion of the CMM resource. The pit surveys and topography surface were checked in Google Earth for accuracy. Horizontal point accuracy is expected to be $<5 \mathrm{~m}$ and vertical accuracy to 0.5 m . The reference datum was GDA94 and the projection was MGA Zone 50. Topographic control appears to be of good quality and is considered adequate for resource estimation.

Regional AC drillhole collar positions were surveyed before and after drilling using a handheld GPS Drillhole location data was captured in the MGA94 grid system.

Down hole surveys were not undertaken for the any of the drilling due to the shallow nature of the holes. Any regional AC intercepts will be followed up with infill RC drilling using downhole surveys and more accurate collar survey technique.
Heap Leach AC collar positions were surveyed using hand held GPS. Drillhole location data was initially captured in the MGA94 grid system. Before further resource evaluation work the drillhole locations will be picked up with DGPS by qualified surveyors.

RC and DD Samples were collected and analysed for each metre down the hole. Samples were collected and analysed for each metre down the hole.
RC hole spacing was between $50 \mathrm{~m} \mathrm{~N} \times 50 \mathrm{mE}$ and $25 \mathrm{~m} \mathrm{~N} \times 25 \mathrm{mE}$, sufficient for resource estimation

Regional AC samples were collected and analysed for gold and multielement by 4 m field composites down the hole, with the EOH individual metre sampled separately for multi element analysis. Hole spacing was predominantly $100 \mathrm{~m} \times 400 \mathrm{~m}, 200 \mathrm{~m} \times 200 \mathrm{~m}$ and $50 \mathrm{~m} \times 100 \mathrm{~m}$ for AC.

Heap Leach AC drilling was predominantly $12.5 \times 12.5 \mathrm{~m}$ spacing.

## Criteria

Orientation of data
in relation to
geological geological structure

## JORC Code explanation

- Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.
- If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.

Sample security
The measures taken to ensure sample security

Audits or reviews

- The results of any audits or reviews of sampling techniques and data

## Commentary

Drill lines are oriented across strike on an MGA grid. MGGP orebody dips at 80 degrees to the East and KGP 25 degrees to the west.

Holes in the drill Programmes have been mostly drilled at inclination of -55 to -60 degrees at MGGP and KGP. The orientation of the drilling is suitable for the mineralisation style and orientation of the target mineralisation.

Where possible the AC exploration drilling programmes are planned to be drilled perpendicular to the orientation of the geology. Significant mineralisation intervals in the AC will be followed up with infill RC drilling to better understand the orientation of mineralisation.

Calico sample bags are sealed into green bags/polyweave bags and cable tied. These bags were then sealed in bulka bags by company personnel and dispatched by third party contractor. In-company reconciliation is completed with laboratory assay returns.

The Competent Person for Exploration Results reported here has visited the project areas where sampling has taken place and has reviewed and confirmed the sampling procedures.

## Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

## Criteria

Mineral tenement and land tenure status

## JORC Code explanation

- Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.
- The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.

## Commentary

MGGP: The resource is located across mining tenements held by wholly owned Capricorn subsidiaries METROVEX PTY LTD and CRIMSON METALS PTY LTD; being M 59/772, E 59/2450, E 59/2594, E 59/2606, G 59/11, G 59/12, G 59/13, G 59/14, G 59/15, G 59/16, G 59/17, G 59/18, G 59/48, G 59/70, L 59/140, L 59/45, L 59/46, L 59/53, M 59/328, M 59/402, M 59/403, M 59/404, P 59/2286, P 59/2287, P 59/2290, P 59/2291, P 59/2306, P 59/2309, P 59/2310.

All of the tenements are subject to a $1 \%$ NSR royalty to Avenger Projects Ltd, including gold production above 90,000 ounces. A royalty is also payable to St Barbara Limited on all gold production in excess of 20,000 ounces (excluding production from historic waste dumps and tailings) at the rate of $\$ 10$ per ounce, applicable to leases M 59/328, M 59/402, M 59/403, M 59/404, G 59/11, G 59/12, G 59/13, G 59/14, G 59/15, G 59/16, G 59/17, G 59/18, L 59/45, L 59/46, L $59 / 53$ No other known impediments exist to operate in the area.

KGP: The Bibra deposit is located in M 52/1070 held by Greenmount Resources, a wholly owned subsidiary of Capricorn Metals.

M52/1070 is within the area of granted E52/1711 exploration tenement in the Pilbara region of Western Australia. E52/1711 was acquired from BHPB in 2008. South32 (via the spin-out from BHPB) retain a $2 \%$ NSR whilst BHPB a claw-back provision whereby BHPB can elect to acquire a $70 \%$ equity in the project only if JORC compliant reported resources of $5,000,000$ ounces of gold and/or 120,000 tonnes of contained nickel have been delineated. The Nyiyaparli People hold Native

|  |  |  |
| Geology |  |  |

## Commentary

Title over the area including E52/1711 and M52/1070. There is no known heritage or environmental impediments over the lease

No other known impediments exist to operate in the area.
MGGP: The Mt Gibson Gold Deposit (Mt Gibson) has a history of minor gold production dating back to the 1930's when prospectors operated small gold workings at Paynes-Crusoe and Tobias Find While the area was subject to previous prospecting and company exploration in smaller leaseholdings, the Mt. Gibson Gold Project was first held in more-or-less its present configuration and extent by Reynolds Australia, who commenced exploration in the early 1980's. Soil and laterite sampling resulted in several significant gold and base metal anomalies being defined; follow up rotary air blast (RAB), air core (AC), reverse circulation (RC) and diamond drilling Programmes outlined significant economic laterite and oxide resources. A joint venture between Reynolds Australia Metals and Forsayth Mining Limited (with FML as the operator) began operations in 1986, mining and processing 6.5 million tonnes of laterite ores defined by FML in 1984, followed later by oxide and sulphide ores defined by drilling beneath the laterite orebodies. The project was sold by Reynolds to Camelot Resources in 1995. Continuing exploration resulted in the discovery of further oxide resources, mainly on the Taurus Trend, and the underground quartz-sulphide deposit at Wombat. These resources were subsequently mined and processed, all mining being completed at the end of 1997 and final milling of low grade stockpiles completed in June of 1998. A 4Mt dump leach remained in operation until November 1998, producing 68,868 ounces of gold. Including the dump leach, a total of $16,477,88$ tonnes of ore was processed during the life of the operation, for 868,478 ounces of gold at an overal verage grade of $1.64 \mathrm{~g} / \mathrm{t} \mathrm{Au}$.
KGP: Prior to Capricorn Metals, E52/1711 was held by Independence group (IGO) who undertook exploration between 2008 \& 2014. Prior to Independence group, WMC (BHPB) explored the area from 2004 to 2008
MGGP: The Mt Gibson Gold Project tenements are located at the southern extremity of the Retaliation Greenstone Belt, in the SW portion of the Yalgoo-Singleton Greenstone Belt in the Murchison Province of the Yilgarn Craton. The tenements are mostly covered by a veneer of alluvial quartz sands and laterite gravels, with sporadic greenstone subcrop and outcrop, increasingly exposed in the north of the project area. The mineralised laterite gravels are situated slightly down-slope from the lode deposits on the Gibson trend. Regionally, the greenstone belt has been metamorphosed to middle amphibolite facies and hosts a number of $\mathrm{Au}-\mathrm{Cu}$ deposits and prospects, including Golden Grove, 90 km to the northwest of Mt.Gibson

The lode style mineralisation at Mt. Gibson is predominantly hosted by three main trends:

## The Gibson Trend

The majority of the known and mined mineralisation is hosted by this trend. It is hypothesised to have originally been a gold-copper-zinc rich Volcanogenic Hosted Massive Sulphide (VHMS) deposit that has been overprinted by a later hydrothermal gold mineralising event. This mineralised shear zone has

## Commentary

## an arcuate north-south to northeasterly strike (trending more north-easterly in the north) and extends

 for more than seven kilometres from the southern granite contact to beyond the Hornet ore body.The so-called "Mine Sequence" is around 400 metres wide and consists of a parcel of sheared, metamorphosed and chlorite-biotite-muscovite altered mafic volcanics. Numerous felsic porphyries intrude the Mine Sequence. Mineralisation is hosted within multiple sets of elongate lodes with strong strike continuity, which anastomose and pinch-swell along strike and to depth. The main lode systems include Hornet, Enterprise, Orion and S2.

## The Taurus Trend

The north-westerly trending Taurus Trend lies west of and diagonal to the Gibson Trend Mineralisation is intimately associated with an apparently continuous felsic unit emplaced into the northwest trending shear and was discovered late in the life of the mining operation. It is characterised by discontinuous ore bodies, and strongly mineralised quartz-sulphide veining. The ore bodies on this trend include Sheldon and Wombat which, although not as continuous in strike as the ore bodies on the Gibson Trend, show a higher gold tenor.

## The Highway Trend

The Highway Trend is a northeast trending shear zone, hosted by a mafic sequence in the western terrain, 11 km northwest of the main mining area. This trend hosts the Highway ore body, and the Phoenix and Aquarius Prospects. It shares many of the characteristics of the Gibson trend, but it appears to lack the VHMS mineralising event and has generally been regarded as a predominantly low-grade system, although work from previous explores suggest it may have greater persistence and significance than previously thought and hence justifies further attention. The project area also hosts a number of BIF and quartz hosted small mineral occurrences including Paynes-Crusoe and MacDonald's Find

KGP: Bibra is part of a large-scale Archaean aged gold mineralised system. The resource is hosted
 dipping structures; Laterite oxide mineralization has developed over the structures close to surface. The primary mineralisation is strata-bound with lineations identified as controlling higher-grade shoots. The deposit is oxidized to average depths of $50-70 \mathrm{~m}$.

All relevant drillhole information can be found in section 1 - "Sampling techniques", "Drilling techniques" and "Drill Sample Recovery" and the significant intercepts table.

## Criteria

Data aggregation methods

Relationsh
between
mineralisation
widths
and
intercept lengths

## Diagrams

## Balanced

reporting
Other substantive exploration data

## Further work

## JORC Code explanation

- In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated
- Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.
- The assumptions used for any reporting of metal equivalent values should be clearly stated.
- These relationships are particularly important in the reporting of Exploration Results.
- If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.
- If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').
- Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.
- Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.
- Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples - size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.
- The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).
- Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive

## Commentary

Reported intercepts include a minimum of $0.5 \mathrm{~g} / \mathrm{t}$ Au value over a minimum length of 1 m with a maximum 2 m length of consecutive internal waste. No upper cuts have been applied. No aggregation methods have been applied for the rockchips. No metal equivalent values are used.

MGGP: The mineralisation dips steeply to the east, and drilling is generally orientated at 60 degrees to the west, meaning intercepts are roughly perpendicular to mineralisation in the majority of cases. Some vertical holes drilled from the base of mined pits and are therefore at a high degree to the mineralisation

KGP: At Bibra, the geometry of the mineralisation has already been defined from previous drilling programs. The intersection angle between drill angle and the perpendicular angle to the ore zone is less than 10 degrees.

Refer to the diagrams in the body of this report

The accompanying document is considered to be a balanced report with a suitable cautionary note

No other material information or data to report.

Further work includes continued resource infill RC drilling at both projects.

## Commentary <br> No Mineral Resource Estimation update being reported.

(Criteria listed in section 1 , and where relevant in section 2 , also apply to this section.)

| Criteria | JORC Code explanation |
| :--- | :--- | :--- |
| Database integrity | -Measures taken to ensure that data has not been corrupted by, for example, transcription or keying <br> errors, between its initial collection and its use for Mineral Resource estimation purposes. |
| Site visits | - $\quad$ Data validation procedures used. |

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
| Geological interpretation | - Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit. <br> - Nature of the data used and of any assumptions made. <br> - The effect, if any, of alternative interpretations on Mineral Resource estimation. <br> - The use of geology in guiding and controlling Mineral Resource estimation. <br> - The factors affecting continuity both of grade and geology. | No Mineral Resource Estimation update being reported. |
| Dimensions | - The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource. | No Mineral Resource Estimation update being reported. |
| Estimation and modelling techniques | - The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used. <br> - The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data. <br> - The assumptions made regarding recovery of by-products. <br> - Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation). <br> - In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed. <br> - Any assumptions behind modelling of selective mining units. <br> - Any assumptions about correlation between variables. <br> - Description of how the geological interpretation was used to control the resource estimates. <br> - Discussion of basis for using or not using grade cutting or capping. <br> - The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available. | No Mineral Resource Estimation update being reported. |
| Moisture | - Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content. | No Mineral Resource Estimation update being reported. |
| Cut-off parameters | - The basis of the adopted cut-off grade(s) or quality parameters applied. | No Mineral Resource Estimation update being reported. |
| Mining factors or assumptions | - Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made. | No Mineral Resource Estimation update being reported. |
| Metallurgical factors assumptions | - The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made. | No Mineral Resource Estimation update being reported. |

## Criteria

| Environmental |  |
| :--- | :--- | :--- |
| factors | or |
| assumptions |  |

assumptions

Bulk density

- Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.
- The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.
- Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.
Classification
- The basis for the classification of the Mineral Resources into varying confidence categories.
- Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).
- Whether the result appropriately reflects the Competent Person's view of the deposit

## Audits or reviews

Discussion of relative accuracy/ confidence

## JORC Code explanation

- Assumptions made regarding possible waste and process residue disposal options. It is always Assumptions made regarding possible waste and process residue disposal options. It is always
necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.
- The results of any audits or reviews of Mineral Resource estimates.
- Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate
- The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.
- These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.

## Commentary

No Mineral Resource Estimation update being reported.

No Mineral Resource Estimation update being reported.

No Mineral Resource Estimation update being reported.

No Mineral Resource Estimation update being reported.

## Section 4 Estimation and Reporting of Ore Reserves

(Criteria listed in section 1, and where relevant in sections 2 and 3, also apply to this section.)

## Criteria

 JORC Code explanation- Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve. - Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of,
$\begin{array}{lr}\text { Mineral Resource } \\ \text { estimate } & \text { for }\end{array}$ the Ore Reserves.
$\qquad$

## Commentary

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
| conversion to Ore Reserves |  |  |
| Site visits | - Comment on any site visits undertaken by the Competent Person and the outcome of those visits. <br> - If no site visits have been undertaken indicate why this is the case. | No Ore Reserve being reported. |
| Study status | - The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves. <br> - The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered. | No Ore Reserve being reported. |
| Cut-off parameters | - The basis of the cut-off grade(s) or quality parameters applied. | No Ore Reserve being reported. |
| Mining factors or assumptions | - The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design). <br> - The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc. <br> - The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc), grade control and pre-production drilling. <br> - The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate). <br> - The mining dilution factors used. <br> - The mining recovery factors used. <br> - Any minimum mining widths used. <br> - The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion. <br> - The infrastructure requirements of the selected mining methods. | No Ore Reserve being reported. |
| Metallurgical factors assumptions | - The metallurgical process proposed and the appropriateness of that process to the style of mineralisation. <br> - Whether the metallurgical process is well-tested technology or novel in nature. <br> - The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied. <br> - Any assumptions or allowances made for deleterious elements. <br> - The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the orebody as a whole. <br> - For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications? | No Ore Reserve being reported. |
| Environmental | - The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterisation and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported. | No Ore Reserve being reported. |

| Criteria | JORC Code explanation | Commentary |
| :---: | :---: | :---: |
| Infrastructure | - The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed. | No Ore Reserve being reported. |
| Costs | - The derivation of, or assumptions made, regarding projected capital costs in the study. <br> - The methodology used to estimate operating costs. <br> - Allowances made for the content of deleterious elements. <br> - The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co- products. <br> - The source of exchange rates used in the study. <br> - Derivation of transportation charges. <br> - The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc. <br> - The allowances made for royalties payable, both Government and private. | No Ore Reserve being reported. |
| Revenue factors | - The derivation of, or assumptions made regarding revenue factors including head grade, metal or commodity price(s) exchange rates, transportation and treatment charges, penalties, net smelter returns, etc. <br> - The derivation of assumptions made of metal or commodity price(s), for the principal metals, minerals and co-products. | No Ore Reserve being reported. |
| Market assessment | - The demand, supply and stock situation for the particular commodity, consumption trends and factors likely to affect supply and demand into the future. <br> - A customer and competitor analysis along with the identification of likely market windows for the product. <br> - Price and volume forecasts and the basis for these forecasts. <br> - For industrial minerals the customer specification, testing and acceptance requirements prior to a supply contract. | No Ore Reserve being reported. |
| Economic | - The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc. <br> - NPV ranges and sensitivity to variations in the significant assumptions and inputs. | No Ore Reserve being reported. |
| Social | - The status of agreements with key stakeholders and matters leading to social licence to operate. | No Ore Reserve being reported. |
| Other | - To the extent relevant, the impact of the following on the project and/or on the estimation and classification of the Ore Reserves: <br> - Any identified material naturally occurring risks. <br> - The status of material legal agreements and marketing arrangements. <br> - The status of governmental agreements and approvals critical to the viability of the project, such as mineral tenement status, and government and statutory approvals. There must be reasonable grounds to expect that all necessary government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent. | No Ore Reserve being reported. |
| Classification | - The basis for the classification of the Ore Reserves into varying confidence categories. | No Ore Reserve being reported. |

## Criteria JORC Code explanation

|  | $\bullet$ |
| :--- | :--- |
| Audits or reviews | $\bullet$ |
| Discussion of <br> relative accuracy/ <br> confidence | $\bullet$ |

- Whether the result appropriately reflects the Competent Person's view of the deposit
- The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).

Discussion of
relative accuracy/ confidence

- Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy
of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of a qualitative
- The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.
- Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.
- It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.

## Commentary

[^0]:    *significant intercepts outside the current 2022 MRE
    ** Samples from heap leach drilling drilling
    ${ }^{* *} 4 m$ Composite sample from western exploration/sterilisation hole outside the current 2022 MRE
